The equation of a curve is $y = x^2 - 3x + 4$.

(i) Show that the whole of the curve lies above the x-axis.

(iv) Find the value of k for which the line is a tangent to the curve.

The equation of a line is y + 2x = k, where k is a constant.

The equation of a line is
$$y + 2x = k$$
, where k is a constant.

quation of a line is
$$y + 2x = k$$
, where k is a constant.

(iii) In the case where
$$k = 6$$
, find the coordinates of the points of intersection of the line and the curve.

the equation of a line is
$$y + 2x = k$$
, where k is a constant.

(ii) Find the set of values of x for which $x^2 - 3x + 4$ is a decreasing function of x. [1]
